Go to the website:

https://github.com/ethereum/mist/releases to download the file which match your system

I download the .deb file so I use the following code to installing:
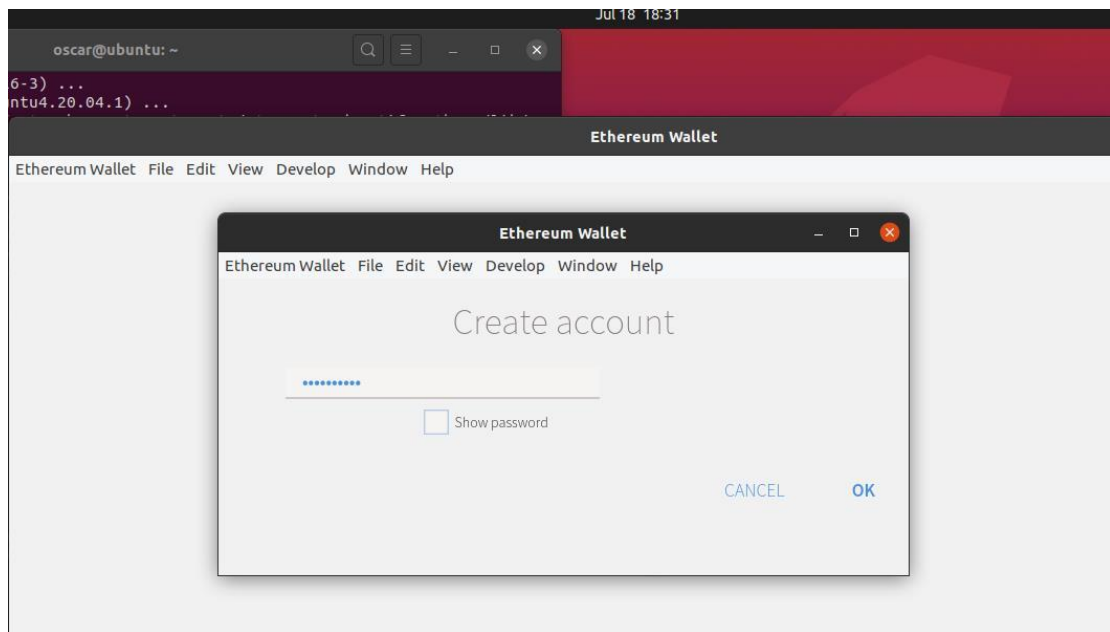

sudo dpkg -i --force-all Ethereum-Wallet-linux64-0-11-1.deb

Because the clock is not synced, so enter : sudo apt-get install ntp

Then we can open the app, and we can create a new account.

But the Wallet's page is keep loading, I google searched this problem and try to fix it, but does not work. And I find serval people have same problem from 2020, so I think it is missing some updates.
